However, Photoshop's editing system is a beast that runs counter to the rapid pace of computer technology. A quick page or image edit, such as making color adjustments or changing the brightness and contrast of an image, can take up to a minute. This is a long time compared to even last year's picture editing technology, and it's even longer compared to competing software. Some digital camera manufacturers and online photo sharing websites, such as SmugMug and Flickr, do offer a service where customers can order and receive a professionally edited version of a digital photo within hours, if not minutes. Offering a large assortment of tools, functions, and features, Photoshop is the closest thing to a one-stop shop for digital imaging. However, like all megamachines, it has its faults. In particular, adjusting color saturation with Photoshop can be difficult. In the least, it's too slow and cumbersome to do by hand, and the number of different tools available in Photoshop, combined with the overlapping of tools in the user interface, can make it difficult to determine which tool to use. In this article, we'll examine the how's and why's of Photoshop's complicated process of color saturation adjustment. There are two basic methods for adjusting saturation: by using the saturation slider found in the Layers palette, and through the use of curves. We'll explore both ways and how they can help you create more professional looking photos. For the purposes of our comparison, we used an 8-megapixel camera. We'll explore the steps to take to translate this sample image into a pretty picture. Saturation 101 Before we dive into the Photoshop saturation slider, let's first explore saturation. We'll touch on what saturation is in Photoshop and how to use the various tools available to adjust it. What the heck is Photoshop saturation? The saturation level of a pixel is the amount of white (or in the case of black and white images, black) in that pixel, relative to the total amount of pixels in the frame. The saturation level of an image is the average saturation of its pixels. In general, the higher the saturation, the more white the image appears. Photoshop has tools to adjust saturation individually as well as through a curve. Some of these tools, such as the levels and curves options, don't necessarily do what you might expect and are worth a closer look. With Photoshop's levels and curves tools, you can set the saturation of individual pixels

Yummy Baby Chicken and Potatoes I have not posted in quite a while, so I thought I would share a fun and super simple recipe for when you want to feed hungry kids with a little left over dinner for you at the same time. I was inspired by my friend Kim, who made this on a rainy day when I am over at her house and she is busy looking after the kids and trying to find enough time to relax and enjoy her kids too. Last week we had the Banned Food Dinner at school, which was a great time, my kids are actually happier than they have been in a while. You can tell when they are happy, they have a different energy in the house. They are bubbling over with excitement and jumping about and it is such a nice feeling, they are so easy to be around and full of energy. Tonight at dinner I made a delicious and fun little baby meals, I used up some chicken, potatoes, pasta, pizza and a little leftover cream cheese. Then I made the most scrumptious little casserole with the leftover pasta and cream cheese sauce. The kids devoured it in minutes and were gone straight after. As it was too late to cook fresh, I made a new dish of corn on the cob, and after that we had a fun playdate with friends. It was a day off for the kids and they were being spoilt rotten – this is why I love the school holidays. Baby meals and casseroles are great fun and easy to make. These will provide you with

a delicious and very easy meal to serve on the run when you have a hungry little one.The principal objective of the proposed research is to perform a detailed molecular analysis of the effects of ras proteins on regulation and expression of the rat plasminogen activator (PAs) system. The PAs system consists of both activator (uPA) and inhibitor (PAI-1) components. Gene knockout and transgenic animal models for two components of the PAs system have been obtained. The knockout animals for the activator component uPA have been characterized in detail, and were used to demonstrate that uPA is essential for embryonic and post-natal development. The effect of the uPA knockout on PAI-1, and the response of the animals to wound healing indicate that uPA is also essential for function of the PAI-1 inhibitory system. The proposed studies involve analysis of the effects of ras proteins on
